Build and Run Java API From NetBeans

Introduction:

This document describes how to build Java API and run sample application from netbeans

Instructions to build JAVA API

1. Download netbeans IDE for respective OS platform(windows/mac/Linux).
2. After download , install the software by following the steps mentioned in the following link:

<https://netbeans.org/community/releases/80/install.html>

3. Download the Mercury API SDK and extract it.
4. Open the project “samples_nb” in Netbeans IDE by giving the path to “SDK\java\”(In this path, you will find “mercuryapi_nb” and “samples_nb” projects).
5. Build the samples_nb project by right click on the project and select “Build” option.

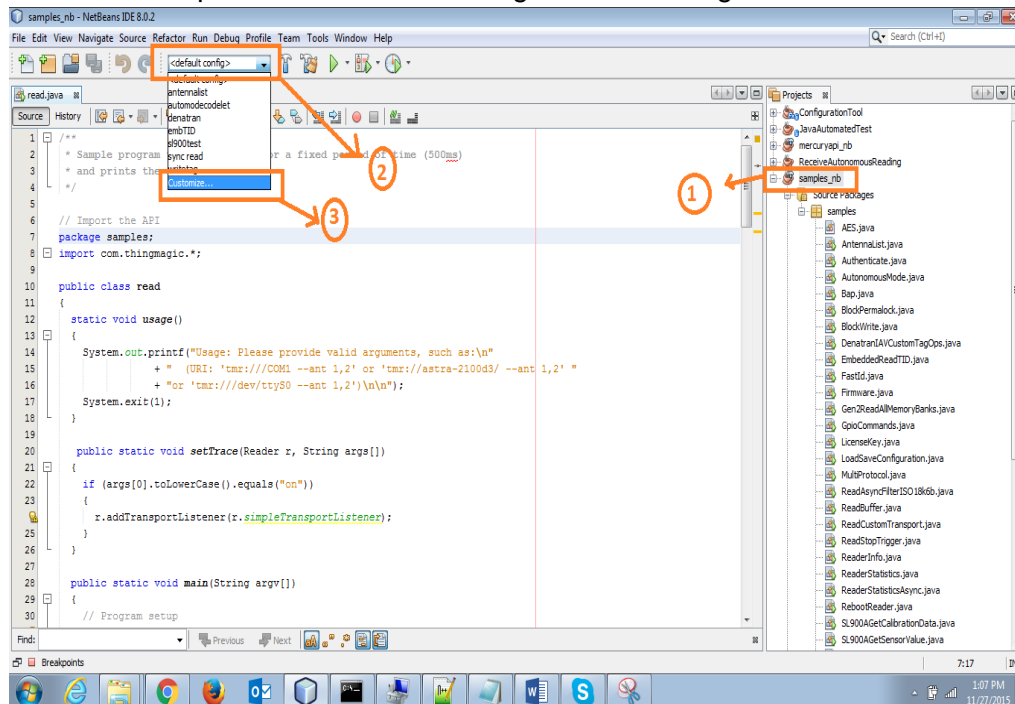

Instructions to find out serial port connected:

1. Open Device manager and check for the serial port number (which is connected to the host machine and to the reader) under “Ports” section.

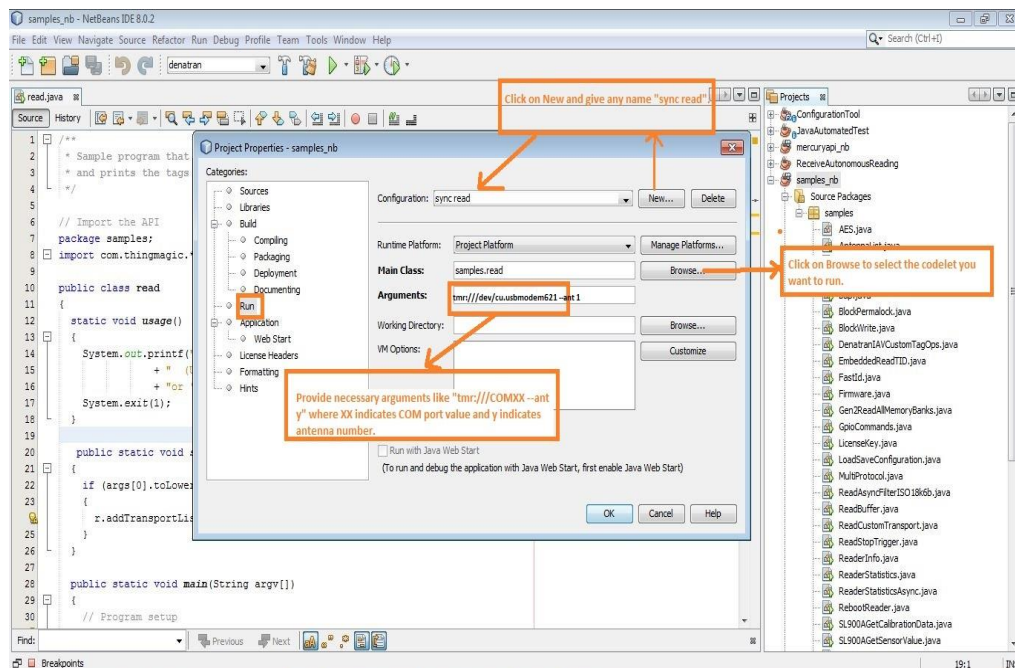

Instructions to run sample codelet

1. After successful build,
 - **To run a sample codelet from netbeans IDE :**
 - (i) Provide the com port and antenna based on the usage provided in the codelet.
 - (ii) For example: To run a sample read codelet, provide the arguments like “tmr:///com21 --ant 1” in the Arguments section as shown in below figure and click on run button at the top. Whereas for demo codelet , you need to provide arguments as “tmr:///comxx” , where xx is com port number.

Follow the steps mentioned in below figures for running the codelet:

A sample_nb Project Properties window appears as shown below.

- **For running a sample codelet from terminal, follow the below steps:**
Go to the directory “SDKROOT/java/samples_nb/dist” and send the command
“java -cp samples_nb.jar:../mercuryapi.jar:../ltkjava-1.0.0.6.jar samples.read
tmr:///comxx --ant x” where xx indicates com port number and x indicates antenna number.
